ABSTRACT

Introduction
Raising tobacco prices is the most effective population-level intervention for reducing smoking, but this is undermined by the availability of cheap tobacco. This study monitors trends in cheap tobacco use among adult smokers in the UK between 2002-2014 via changes in product type, purchase source, and prices paid.

Methods
Weighted data from 10 waves of the International Tobacco Control policy evaluation study were used. This is a longitudinal cohort study of adult smokers with replenishment; 6169 participants provided 15812 responses. Analyses contrasted 1) product type: roll-your-own (RYO) tobacco, factory made packs (FM-P), and cartons (FM-C); 2) purchase source: UK store-based sources (e.g. supermarkets, convenience stores) with non-UK/ non-store sources representing tax avoidance/ evasion (e.g. outside the UK, duty free, informal sellers); and 3) prices paid (inflation-adjusted to 2014 values). Generalised Estimating Equations tested linear changes over time.

Results
1) RYO use increased significantly over time as FM decreased. 2) UK store-based sources constituted approximately 80% of purchases over time, with no significant increases in tax avoidance/ evasion. 3) Median RYO prices were less than half that of FM, with FM-C cheaper than FM-P. Non-UK/ non-store sources were cheapest. Price increases of all three product types from UK store-based sources from 2002 - 2014 were statistically significant, but not substantial. Wide (and increasing for FM-P) price ranges meant each product type could be purchased in 2014 at prices below their 2002 medians from UK store-based sources.

Conclusions
Options exist driving UK smokers to minimise their tobacco expenditure; smokers do so largely by purchasing cheap tobacco products from UK stores.
IMPLICATIONS

The effectiveness of price increases as a deterrent to smoking is being undermined by the availability of cheap tobacco such as roll-your-own tobacco and cartons of packs of factory-made cigarettes.

Wide price ranges allowed smokers in 2014 to easily obtain cigarettes at prices comparable to 12 years prior, without resorting to tax avoidance or evasion.

UK store-based sources accounted for 80% or more of all tobacco purchases between 2002-2014, suggesting little change in tax avoidance or evasion over time.

There was a widening price range between the cheapest and most expensive factory-made cigarettes.
INTRODUCTION

Raising taxes on, and thereby the price of tobacco is the most effective population-level intervention for reducing smoking,[1,2] and among the few policies shown to reduce inequalities in smoking.[3-6] The World Health Organization (WHO) identifies price and tax measures as one of the key areas of tobacco control,[7] and the UK is leading the way, with real tobacco prices among the highest in the world.[8,9] The potential public health benefits of tobacco tax increases are, however, influenced by a variety of factors including the availability of cheap tobacco and smokers’ purchasing choices. There is mounting evidence that smokers would be more responsive to price increases with fewer opportunities to obtain cheap tobacco.[1,10-12] Disadvantaged smokers are more likely to use cheap tobacco,[13-16] so its availability may also contribute to the widening socio-economic disparities associated with smoking. The present study therefore aims to track cheap tobacco sources and use among adult smokers in the UK between 2002 and 2014 via changes in product type, purchase source, and prices paid, and to identify the implications for tobacco tax policy.

Smokers can minimise their tobacco expenditure by changing the type of product they buy or the source from which they buy it. In terms of product type, smokers can change from more expensive factory-made (FM) cigarettes to cheaper roll-your-own (RYO) tobacco,[17,18] change the brand they smoke (there is a large range in price between 'premium' and 'discount' brands [14,19]), or purchase in bulk (FM cigarettes are often cheaper purchased in bulk by the carton than by the single pack [20,21]). With regards to purchase source, smokers can purchase from supermarkets rather than convenience stores, or from sources where duties are either minimised or not paid at all. The latter includes legal products (e.g. duty-free, or from low tax jurisdictions outside the UK - commonly known as tax avoidance [22]), and illicit tobacco (including counterfeit and smuggled - commonly known as tax evasion [23]). The incentives for smokers to change their purchasing behaviours will depend on the price differences between, and ease of obtaining, the varying products.
In the UK during the study period of interest, changes occurred both in the rates of tobacco taxation and in the strategies adopted to curb illicit trade, so a rise in tobacco prices over time and a reduction in illicit trade were expected. From 2001 to 2008, tobacco taxation increased at the rate of inflation. In 2010, the UK government modified the tobacco tax structure, in part to combat the industry segmentation of the market into 'premium' and 'discount' sectors, and also committed to keeping tobacco duty at least 2% above inflation from 2011 to 2014.[24,25] In 2011, an additional 10% increase on RYO duty was also implemented.[24] The UK tobacco duty rates from 2001 to 2014 are presented in Table 1. The first comprehensive strategy to tackle illicit tobacco in the UK was implemented in 2000 and included £201 million of targeted funding, 1000 new customs staff, a national network of freight scanners, the introduction of “UK duty paid” markings on all tobacco packs, harsher penalties for tobacco smuggling, co-operation with tobacco companies to reduce the availability of tobacco to smugglers, and an awareness-raising publicity campaign.[26] This strategy was reinforced and updated in 2006 with the major change being an increased focus on RYO,[27] and also in 2011 where changes in EU law allowed for tougher sanctions for illicit traders.[28] A recent government review has credited these efforts with reducing the UK illicit tobacco market from 22% for FM and 61% for RYO tobacco in 2000, to 10% for FM and 39% for RYO tobacco in 2013/14.[29] In 2009, a programme to tackle illicit tobacco in the north of England was also launched, which placed an emphasis on reducing the demand for illicit tobacco, and this was also evaluated as largely meeting its aims.[30]

Availability and use of cheap tobacco is associated with reduced smoking cessation,[11-13,31] underlining the importance of understanding the sources and types of cheap tobacco and the incentives underpinning their use. Research to date has indicated that RYO use in the UK is increasing,[18] particularly among younger smokers,[32] and between 2006 to 2009 the market share of discount FM brands increased significantly in the UK while their prices remained largely unchanged.[19] In contrast, self-reported tax avoidance and evasion showed a declining trend among UK smokers from 2002 to 2011.[33] Understanding the trends in cheap tobacco use is vital
for informing tobacco control policy not least because the tobacco industry and its allies repeatedly argue that tax evasion is increasing in light of high tobacco taxes in the UK.[34,35] With other countries looking to increase tobacco taxes, yet fearful of the potential impact on illegal sales and tax revenues, this paper will be of importance further afield.

Prior studies examining price minimising have focused on one particular aspect, or considered a limited time frame (e.g. [34]). The present study will use data from the International Tobacco Control (ITC) study [35,36] to track cheap tobacco sources and use among adult smokers in the UK between 2002 and 2014. It will do so by monitoring changes in product type, purchase source, and prices paid. The ITC is unique in making it possible to track concurrently multiple forms of price minimising behaviour in a single dataset over a substantial period.

METHODS

Participants
Data were from the first ten waves (2002 to 2014) of the UK arm of the ITC project.[35,36] This is a longitudinal cohort survey of adult smokers (18+) at recruitment with yearly replenishment (except at wave eight). Respondents who quit are also followed up. The survey uses a stratified random sample design and was administered either via computer-aided telephone interviewing or online (piloted in wave seven, and introduced gradually from wave eight in 2010 onwards). Surveys were conducted approximately annually, although some longer inter-wave intervals resulted in no surveys taking place in 2009, 2011, or 2012. Population cross-sectional sampling weights were calculated at each wave to be representative of national distributions of age, sex, and geographical region, and longitudinal weights were adjusted for attrition. Participants were included in the present analyses if they smoked at least monthly at the time of the survey and had smoked more than 100 cigarettes in their lifetime. Table 1 presents the demographic characteristics of the eligible study sample: \( N = 6169 \) participants who provided 15812 responses over the 10 waves. On average, each individual took part in 2.6 surveys \( (sd = 2.0) \).
Measures

Demographics

For descriptive purposes and missing data analyses, participants at each wave were asked their sex, age, annual household income, household composition, and geographical region. Household income was adjusted for household composition, converted to 2014 values using Consumer Price Index (CPI) data from the UK Office for National Statistics,[37] and stratified to "low", "medium", and "high" values. Refusals to report income were retained as a separate category.

Cheap tobacco - product type and purchase source

Figure 1 presents a schematic of the survey questions used to classify tobacco product types and purchase sources. Each participant's usual tobacco product was determined by asking "Do you now smoke... (packet/factory-made cigarettes only; roll-your-own cigarettes only; both)?" All remaining indicators of cheap tobacco use were based on participants' last reported tobacco purchase. These were classified as FM cigarettes by the pack (FM-P), FM cigarettes in a carton containing multiple packs (FM-C), or RYO tobacco. Smokers who indicated having a usual brand and variety of tobacco (see Figure 1), were asked if their last purchase was their usual brand. Buying non-usual brands may indicate being less brand-loyal or more swayed by in-store discounts and price-promotions.

To address the difficulties associated with clearly identifying tax evasion from tax avoidance in self-report surveys (such as socially desirable responding, the prevalence of "under-the-counter" sales from legitimate sources, and counterfeit tobacco that smokers may be unaware of purchasing [34,38-40]) a novel approach to classifying tobacco purchase sources was undertaken. Sources that are easily accessible to the majority of UK smokers were contrasted with sources where arguably an effort was made to obtain cheap tobacco. The former were considered to be "UK store-based" sources (e.g. supermarkets, convenience stores, and tobacconists), and the latter
to be "non-UK/ non-store" sources (e.g. duty-free, overseas, internet, and informal sellers). An "other" category captured the remaining sources, which represented less than 0.52% of all responses (see Figure 1). Keeping these uncertainties in mind, it was nevertheless expected that within the non-UK/ non-store category, "outside the UK" and "duty-free" were likely to be tax avoidance, and "informal sellers" and "from friends/ relatives" to be tax evasion.

**Tobacco price.**

Price per stick (FM cigarettes: all waves; RYO: available only from Wave 4 in 2005, onwards) was also derived from the last purchase. Based on available data from the most recent six waves (2006 - 2014), the average grams of tobacco per RYO cigarette for this UK sample was calculated to lie between 0.45 - 0.55 grams (data not shown), which is consistent with other research.[41-43] The mid-point of 0.50 grams was chosen as the amount of tobacco per cigarette for calculating price per stick for RYO smokers. Depending on whether the last purchase was FM-P, FM-C, or RYO (see Figure 1), a further series of questions determined how many cartons/ packs were purchased, how many packs per carton, how many cigarettes per pack, or the number and weight of RYO pouches purchased. Participants then had the option to report the price of a single unit (one carton, pack, or pouch) or the total paid, if they had purchased multiple units. This was then divided by the number of cigarettes or 0.50 grams of tobacco purchased. Since price calculations relied on these multiple responses, the occurrence of inconsistencies and missing data was increased. The following improbable responses (determined a-priori by consensus among the authors) were therefore excluded from price analyses: a) all prices per FM stick or 1.0 gram of RYO tobacco over £0.50 (prior to Wave 6) or £0.80 (Wave 6 onwards); b) prices per FM stick or 1.0 gram of RYO tobacco from UK store-based sources below £0.07 (prior to Wave 6) or £0.10 (Wave 6 onwards); and c) FM packs from UK store-based sources reported to contain more than 50 cigarettes. For comparability over time, all prices were converted into 2014 values using CPI data.

The median reported price for each product type last purchased within each source was
calculated, and for UK store-based sources only, the "price range" for each product type was also calculated. The price range was truncated to lie between the 2.5th and 97.5th percentiles (capturing 95% of all prices), in an attempt to obtain a more representative value by excluding the most extreme low-frequency cases.

**Analyses**

The aim was to examine general population trends in cheap tobacco use, rather than perform predictive modelling. The main results therefore comprise the population-weighted proportion of smokers at each wave using cheap tobacco, and purchasing from various sources, without controlling for any covariates. Multilevel logistic regression analyses using Generalised Estimating Equations (GEE) was also conducted to test for linear trends in proportions over time. GEE estimates population-averaged effects and controls for correlated responses from the same individual over multiple time points. These analyses used a binomial distribution with a logit link function, and an unstructured correlation matrix (or exchangeable when the unstructured failed to converge). GEE was also used to test for linear trends in the prices paid for each product type within each purchase source, via multilevel linear regression analyses using a gaussian distribution with an identity link function. GEE analyses have commonly been used with the ITC data.[14-17,33]

**Missing data and attrition**

Missing data for most of the variables used were minimal (see Table 2). However the price paid for the last purchase could not be calculated for a relatively large proportion of participants due to missing data (2.3% - 15.2% per wave) or exclusion due to improbable responses (1.0% - 3.7%). Chi-squared analyses were therefore used to compare the group who were excluded from price calculations to the rest of the sample on their responses to the remaining variables. This showed that in a majority of the 10 waves the price missing group was significantly ($p < 0.05$): less likely to
purchase by the pack rather than the carton or RYO (all waves); less likely to usually smoke exclusively FM cigarettes (9 of 10 waves); less likely to report their purchase source (9 of 10 waves); less likely to report purchasing from UK store-based sources (6 of 10 waves); and less likely to disclose their income (5 of 10 waves). This pattern of responses suggests that the price missing group were more likely to be using cheap tobacco. Estimates of tobacco price, particularly from non-UK/ non-store sources are therefore likely to be slightly overestimated, and this should be taken into consideration when interpreting results on price.

Participants who had been included in any one survey year were excluded from analyses at subsequent years if they were lost to follow-up (25.5% of all valid participants), had quit smoking (8.0%) or had missing data (0.6%).

**RESULTS**

The prevalence of RYO use increased significantly and the majority of purchases were from UK store-based sources. There was little change observed in the real prices of cigarettes over the survey period from 2002 to 2014.

**Type of product (usual tobacco product and product last purchased)**

Usual tobacco product type showed a significant linear increase in exclusive RYO use over time (Table 2), with the main increase occurring between 2002 and 2010, then plateauing. Simultaneously, exclusive FM use significantly declined, such that by 2014, only 55% were smoking exclusively FM, 30% RYO, and 15% smoking a mix. The linear trend for mixed FM and RYO use was not statistically significant, although the increase from 10.2% in 2010 ($\pm95\%\ C.I. = 7.2\% - 13.1\%$) to 18.2% in 2013 ($\pm95\%\ C.I. = 15.3\% - 21.2\%$) coincided with the plateauing of exclusive RYO use. Consistent with this, based on the last purchase data, purchases of FM
cigarettes (by the pack and carton) declined significantly as purchases of RYO increased over the survey period.

For all smokers (FM, RYO and mixed), there was a significant linear increase over time in the proportion who reported that their last purchase was their usual brand (see Table 2). Among exclusive FM or RYO smokers, the proportion last purchasing their usual brand was generally high (above 90% in most waves), whereas for mixed users it was somewhat lower, ranging between 66.0% (±95% C.I. = 58.0% - 74.1%) in 2003 to 83.8% (±95% C.I. = 74.9% - 92.8%) in 2013.

Source of last tobacco purchase

UK store-based sources accounted for 80% or more of all purchases (Table 2), and this proportion did not vary significantly over time. The majority of UK store-based purchases were from convenience stores and supermarkets. Within this group, however, there was a significant decrease in purchases from convenience stores and a corresponding increase in supermarket purchases over time, such that by 2014, significantly more purchases were from supermarkets (54.1%; ±95% C.I. = 50.0% - 58.1%) than convenience stores (40.0%; ±95% C.I. = 36.0% - 44.0%).

Purchases from non-UK/ non-store sources showed a significant downward linear trend over time. It is therefore unexpected that purchases from UK store-based sources did not show a statistically significant linear increase, but remained relatively stable over time. This is attributable to the proportion with missing data on source (see Table 1). These participants were arguably more likely to have purchased from non-UK/ non-store sources, because smokers with missing data on price had a pattern of missing data consistent with using cheap tobacco (including missing data on source). When all missing data was assumed to be non-UK/ non-store purchases, the linear trends were no longer statistically significant. Whichever way the missing cases are categorised, there was no indication that non-UK/ non-store purchases were increasing overall.

Within the group purchasing from non-UK/ non-store sources, purchases from outside the UK were most common (40% or more in most waves), but declined significantly over time, with
the largest drop occurring between 2007 and 2008. Duty-free purchases showed a significant linear increase with time, reaching 36% in 2014. Purchasing from informal sellers was below 17% in all waves, and significantly decreased over time. Purchasing from friends or relatives was initially very low, but increased significantly over time, reaching a peak in 2010 at 23.6%. Online and phone purchases combined accounted for less than 7% of all non-UK/ non-store purchases over the survey period.

At least 97% of FM-P purchases were from UK store-based sources (Table 2). These consistently high figures constituted ceiling effects and precluded statistical tests for linear trend. Relatively fewer FM-C purchases were from UK store-based sources (between 45.1% to 70.7% over the survey period). However, these increased significantly over time, whereas FM-C purchases from non-UK/ non-store sources significantly declined. This suggests that the overall decline in FM-C purchasing noted earlier was largely due to a decline in non-UK/ non-store sources. Finally, the proportion of RYO purchases made from UK store-based sources increased significantly over time, whereas those from non-UK/ non-store sources declined.

**Tobacco price**

*UK store-based sources*

Significant linear increases over time were observed in the real prices of all tobacco product types from UK store-based sources. Prices remained essentially unchanged up to 2010, however, then increased slightly thereafter (Figure 1). In real terms, the median price per stick for FM cigarettes (both pack and carton purchases) rose by only 10 pence over the entire 12 years of the study. Median prices per stick for FM-P rose from £0.27 in 2002 to £0.37 in 2014, with FM-C typically one or two pence cheaper per stick. For RYO, the real median price per stick (0.50 grams) increased by only five pence over the nine-year period for which data were available, from £0.12 in 2005 to £0.17 in 2014.

The price *range* for tobacco products purchased from UK store-based sources varied by
product type (Figure 2), but across all three it was possible in 2014 to buy the same type of product at real prices similar to 2002. The range for FM-P was relatively narrow and changed little between 2002 (£0.12 per stick) and 2010 (£0.13), followed by an increase to £0.16 in 2013, and then a more marked widening to £0.23 in 2014 where both an increase in the highest price and a decrease in the lowest price was evident. For FM-C, although median prices were similar to FM-P, the range was wider and more variable, ranging between £0.19 and £0.27 in most years, with spikes of £0.37 in 2007 and £0.45 in 2014. The price range for RYO tobacco changed little over the period measured, from £0.10 in 2005 to £0.12 per 0.50 gram stick in 2014. It may be seen in Figure 2, however, that for FM-P the prices were evenly distributed over the range, whereas for RYO they were negatively skewed, such that there was greater variation at the cheaper (below median) end of the price range.

Non-UK/ non-store sources

FM-P from non-UK/ non-store sources accounted for a very small portion of tobacco purchases (see Table 2), so there were limited data available to calculate precise estimates of median prices per stick, and trend analyses were not conducted. As may be seen in Figure 2, however, median prices were consistently at least £0.02 below that of FM-P from UK store-based sources, although the fluctuations were large. More consistent price estimates were obtained for FM-C, which were often less than half the price of UK store-based sources, and changed little (£0.11 per stick in 2002 and £0.16 in 2014), although this increase was statistically significant. Similarly, median prices for non-UK/ non-store RYO tobacco were considerably cheaper than UK store-based sources, ranging from £0.05 per 0.50 gram stick in 2005 to £0.08 in 2016, again a significant linear increase. Median prices from non-UK/ non-store sources were often cheaper than the cheapest products available from UK store-based sources, for all tobacco product types (see Figure 2).
DISCUSSION

This paper shows there are numerous options for UK smokers to minimise their tobacco expenditure, thus mitigating the public health impact of tobacco tax/price increases. They do so largely by purchasing cheap products from UK stores (84% purchased from cheap sources in 2014). Significant increases in exclusive RYO use, and declines in exclusive FM cigarette use were observed. A considerable proportion of smokers (15% in 2014) were identified who usually smoked both RYO and FM products, and this group appeared to be the least brand loyal.

Purchasing FM by the carton was not uncommon, with around one in six smokers choosing to buy FM cigarettes in bulk this way. We found no evidence to support industry arguments that smokers are increasingly engaging in tax avoidance or evasion, insofar as this is captured in this study by non-UK/non-store sources. The analysis of real prices supports these findings. There were clear price incentives to ‘down-trade’ both between and within products purchased from the legal market (UK store-based sources). Hence although for all three product types (FM-P, FM-C, and RYO) the median price from non-UK/non-store sources was typically lower than the cheapest products from UK store-based sources, it was possible to purchase all three types, legally, at prices below their 2002 medians.

Although the trading of illicit tobacco products from UK store-based sources cannot entirely be ruled out, the present findings suggest tax avoidance and evasion are not the predominant source of cheap tobacco. A change in the most common source of tobacco purchases in the UK occurred during the study, from convenience stores to supermarkets, which would have conferred price savings. Changing product type also enabled considerable savings. For example, FM-C purchases typically conferred a saving of £0.01 to £0.03 per stick on the median price, compared to FM-P. A larger saving could be made by switching to RYO, a 0.50 gram stick being typically around £0.18 cheaper than one FM-P cigarette: less than half the price. For the average UK smoker smoking
around 11.4 cigarettes per day,[44] this is a saving of about £750 per year compared to smoking FM-P. Changing within product types also led to savings. The price range between the cheapest and most expensive FM-C products was consistently wide, and from around 2010 onwards, the price range of FM-P products also widened markedly, providing more opportunities to switch to cheaper brands. The tobacco industry pricing strategy of over-shifting tax increases on premium FM brands to maximise profits, while under-shifting to maintain lower prices for discount FM brands has been observed worldwide.[10,15,19,45,46] The present findings indicate that this strategy is becoming more aggressive in the UK. Unlike for FM-P, the observed price range for RYO was disproportionately due to more variation in the cheap (below median) prices. This suggests that industry under-shifting may be particularly relevant within the RYO market, a finding not previously observed.

Purchasing from non-UK/ non-store sources did not increase overall (even when we assumed all missing data on purchase source to be non-UK/ non-store) and the non-significant trends were for a decrease. However, some more specific trends are worth highlighting. The majority of non-UK/ non-store purchases were duty-free or from outside the UK, with purchasing from duty-free sources increasing significantly over time and non-UK purchases declining. There were few reports (typically under 25% of non-UK/ non-store purchases and under 5% of all purchases) of sources most likely to be tax evasion, such as informal sellers or from friends or relatives. Purchasing from informal sellers significantly decreased over the survey period whereas purchasing from friends or relatives increased, reaching a peak in 2010 at just under a quarter of all non-UK/ non-store purchases. Online and phone purchases combined accounted for less than 7% of all non-UK/ non-store purchases over the survey period. FM-C was most commonly purchased from non-UK/non-store sources, followed by RYO.

The economic recession that occurred in the UK in the last quarter of 2008 appeared to influence tobacco purchasing patterns. Around this time, purchases from supermarkets overtook convenience stores as the most popular purchase source, there was also a drop in purchases made
outside the UK, and a spike from informal sellers and friends or relatives. Government policies have also played a role. For example, the period from 2011 onwards where tobacco duty was higher than in previous years (at 2% to 5% above inflation) coincides with the more accelerated increase in tobacco prices from UK store-based sources observed in the present study. Even if this relationship was causal, however, the tax increases did not have a substantial impact on prices in real terms, had no apparent effect on the widening gap between the cheapest and most expensive FM-P products, and little impact on the lowest price paid for RYO. Overall, when inflation is taken into consideration, although statistically significant, the increase in the median price paid for tobacco between 2002 and 2014 was not substantial. On the other hand, the UK strategies to reduce illicit tobacco supply and use appears to have been successful.[30,47] Taken together, purchases from sources that would most likely represent tax evasion and avoidance did not increase.

**Policy implications**

Whilst efforts have been made in the UK in recent years for higher tax increases on RYO than those of FM,[24] considerable price differentials remain. We echo the call from previous UK researchers [18] for larger relative tax increases for RYO to reduce the price differentials, a move which is likely to result in a reduction in RYO consumption.[16] In order to further address the tobacco industry practice of under-shifting tobacco prices on FM cigarettes, the UK government has committed to introducing a Minimum Excise Tax (MET) in 2017, which will help to raise the price of the cheapest FM tobacco brands.[48] The exact value of the MET is not yet known, and careful observation will be required to determine if it is sufficient. For maximal impact, the MET should be at least equivalent to the amount of tax currently due based on the weighted average price of tobacco.[49] Alternative measures such as price-cap regulations [50] and moving towards a fully-specific tax structure [13,15] may better address this problem. The sale of FM cigarettes in cartons could also be banned, the limits on duty-free purchases could be further reduced or removed altogether, and cross-border purchases could be limited given the close proximity of the UK to
countries with cheaper tobacco. The current rate of increase of 2% above inflation for UK tobacco excise taxes could also be raised to strengthen impact. Combining this with the other measures outlined could help to increase price while reducing price differentials and the availability of cheaper tobacco.

**Further research**

Purchases from friends or relatives have remained at rates significantly higher than what was observed at the start of the study period. More research is needed to determine whether this constitutes tax avoidance and/or tax evasion, or an effort to pool resources in order to buy in bulk. Sub-populations of particular interest are mixed smokers of both RYO and FM cigarettes, and also those who do not consider themselves to be brand loyal. These groups may be particularly susceptible to tobacco price changes and warrant further exploration. Our research team is currently exploring the socio-economic and addiction-related factors associated with cheap tobacco use to assist in the development of more targeted price-based smoking intervention strategies.

**Limitations**

The survey included a considerable period (2011 and 2012) where no data were collected, precluding the observation of any fluctuations specific to this period, and perhaps over-estimating the linear nature of the trends over time. The large, longitudinal sample of smokers does, however, allow for the observation of overall patterns with some confidence. It is not possible to definitively pinpoint instances of tax evasion in self-reports, as in this study and described in detail elsewhere,[16] and this may explain discrepancies with UK government estimates.[51] In particular, "under-the-counter" purchases from legitimate sources cannot be ruled out. This is unlikely, however, as reports of very low prices paid from UK store-based sources were excluded in an effort to overcome this issue. The continuing availability of very low-priced tobacco products from UK store-based sources may be due to a deepening of discounting, increased tax-evasion, or
both. Framing the problem in terms of UK store-based versus non-UK/non-store sources, however, has the advantage of contrasting ease of access for the majority of UK smokers with directed efforts to buy cheaper. If cheap tobacco is increasingly available from the most accessible sources, then this is something that requires careful monitoring, whether or not it is due to tax evasion.

To be included in the study, participants had to be current smokers, so our procedure meant that quitters were progressively excluded from the analysis. However, the missing data analysis also suggested that users of cheap tobacco (who are less likely to quit [11-13,31]) were more likely to be excluded. Thus these two effects balance each other to some extent. To minimise attrition effects the ITC survey is also replenished at each wave with a representative sample of current smokers, so we think it is unlikely that the observed trends are due to attrition.

**Conclusions**

UK smokers have many options to reduce their tobacco expenditure, and largely do so by purchasing from UK stores. Wide price ranges for each product type (FM-P, FM-C, RYO) from UK store-based sources in 2014 meant that smokers could buy the same products legally at prices comparable to 2002, 12 years prior. Price differences between product types also drove switching from FM to RYO, or from FM-P to FM-C. Several policies that could mitigate these trends have been highlighted.
FUNDING

This project was funded by the National Institute for Health Research Public Health Research (project number 13/43/58).

</table>

$^a$ Specific duty is set in fixed cash terms as an amount per 1000 FM cigarettes or per kilogram of RYO tobacco.

$^b$ Ad Valorem duty is set as a percentage of the retail price, and is only applied to FM cigarettes.

$^c$ Value Added Tax (VAT) is set as a percentage of the retail price and is applied to all consumer goods.

$^d$ Data taken from Action on Smoking and Health (ASH) UK analysis of tobacco tax increases in the United Kingdom fact sheet [24].

⁴UK store-based other category includes discount stores, tobacconists, bars/ entertainment venues, off-licenses, vending machines, and unclassified UK store-based responses; “non-UK/ non-store other” category includes military commissaries, toll-free numbers, internet purchases, refusal to answer and unclassified non-UK/ non-store responses.
FIGURE CAPTIONS

Figure 1.
Schematic of survey questions and categorisation of source and type of tobacco products.
*Note: The low reported prices associated with refusals to answer were consistent with this source being classified as "non-UK/ non-store".

Figure 2.
Weighted median price over time of tobacco for factory-made packs, factory-made cartons, and roll-your-own tobacco, purchased from UK store-based sources (bold lines) and non-UK/ non-store sources (dotted lines). Shaded area represents 95% of all prices (excluding minimum and maximum 2.5%) from UK store-based sources, and is indicative of the price range. Light lines represent the 25th and 75th percentiles. All prices are adjusted to 2014 values and based on the most recent purchase. * Indicates no data collected for these years.
Figure 1

Do you smoke?

USUAL TOBACCO PRODUCT

- Factory-made cigarettes (FM)
- Both (mixed)
- Roll-your-own cigarettes (RYO)

Do you have a regular brand and variety of cigarettes?

NO

Where did you LAST buy cigarettes/RYO tobacco for yourself?

SOURCE OF LAST PURCHASE

UK STORE-BASED

- CONVENIENCE STORES
- Petrol stations
- News stands
- Kiosks

- SUPERMARKETS

- "OUTSIDE THE UK"

- "INFORMAL SELLERS"
- Not at a store, shop, or other mainstream establishment, selling cigarettes independently and/or illegally, perhaps at local markets, delivery service, door-to-door, or just in the street

- "DUTY-FREE"

- "NON-UK/ NON-STORE OTHER"
- Military
- Free phone number
- The internet
- Refuses to answer

OTHER

Don’t know
Missing responses
Could not classify (e.g. “from work”)

Did you buy [your last purchase] by the carton, the pack, or as single cigarettes?

Single cigarettes/baggies (excluded: 0.9% of responses)

PRODUCT LAST PURCHASED

- Pack (FM-P)
- Carton (FM-C)
- RYO

Was it your current brand?

NO

WHERE did you LAST buy cigarettes/RYO tobacco for yourself?

LAST PURCHASE = USUAL BRAND

YES

This last purchase — was it FM cigarettes or RYO tobacco?

FM

RYO
