20 **Abstract**

21 **Background:** Little is known about the clinical characteristics of patients referred to a diagnostic centre
22 through the Danish urgent referral pathway for non-specific serious symptoms. We aimed at estimating the
23 distribution of serious disease and the diagnostic value of clinical characteristics for the diagnosis of cancer
24 and serious non-malignant disease in these patients.

25 **Method:** A cohort study of 938 patients referred by their GP to the diagnostic centre at Silkeborg Regional
26 Hospital. All patients were followed up for three months in national registries. The likelihood ratio (LR) of
27 cancer or serious non-malignant disease were calculated in relation to clinical characteristics.

28 **Results:** A total of 327 (34.9%) patients were diagnosed with new serious disease within three months: 118
29 patients (12.6%) with malignant disease and 209 patients (22.3%) with non-malignant disease. Most
30 patients presented general symptoms. The highest LR of cancer was found for abdominal mass, high lactate
31 dehydrogenase or abnormal findings in the diagnostic imaging. The highest LR of non-malignant disease
32 was found for swollen joints or abnormal auscultation of lung or chest.

33 **Conclusions:** Patients referred by their GP to the diagnostic centre have high risk of serious disease. A
34 multidisciplinary diagnostic approach is needed to embrace the diagnostic spectrum.

35

41 **1. Introduction**

42 An urgent referral pathway for non-specific serious symptoms was implemented in Denmark in 2011-2012
43 [1]. This pathway was part of the Danish three-legged cancer strategy and supplemented the urgent
44 referral pathways, which were based on alarm symptoms for specific cancer types [2]. The aim was to
45 expedite cancer diagnosis by providing new referral possibilities from general practice for patients with
46 non-specific symptoms that could be signs of serious disease [3].

47 The implementation was supported by studies demonstrating that the urgent referral pathways favoured
48 patients presenting with specific alarm symptoms of cancer, whereas patients not presenting with these
49 specific alarm symptoms had increased diagnostic intervals [4,5]. A Danish study among general
50 practitioners (GPs) showed that half of cancer patients presented with symptoms that could not be
51 categorised as alarm symptoms at first presentation; they presented with either non-specific serious
52 symptoms (20%) or vague symptoms (30%) [4].

53 To prevent long-lasting fragmented diagnostic pathways, the urgent pathway for non-specific serious
54 symptoms was designed as a two-step approach [3]. First, the GP initiates the diagnostic workup on the
55 basis of the imaging results and a standardised panel of blood tests ("triage function"). Second, if relevant,
56 the patient is referred to the diagnostic centre, where a multidisciplinary team takes over the responsibility
57 for the patient [6].

58 Non-specific symptoms do not have an obvious link to one certain disease type or organ system. Therefore,
59 the referral criteria in the urgent referral pathway for non-specific serious symptoms are less definitive
60 than the symptoms in the pathways for specific cancer types [1]. Thus, little is known about the clinical
61 characteristics of patients referred to the diagnostic centre from the GP or about the diagnostic spectrum
62 of serious disease and the role of the clinical characteristics in the diagnosis of serious disease among
63 referred patients.

64 The aim of this study was to estimate the distribution of serious disease (cancer and serious non-malignant
65 disease) and to describe and quantify the diagnostic value of the clinical characteristics for the diagnosis of
66 serious disease among patients referred by their GP to the diagnostic centre at Silkeborg Regional Hospital.

67 **2. Material and Methods**

68 *2.1 Study design*

69 A prospective cohort study of patients aged 18 years or more referred by their GP to the diagnostic centre
70 at Silkeborg Regional Hospital through the urgent referral pathway for non-specific serious symptoms
71 between 1 July 2012 and 30 September 2014. Patients were followed up for three months in national
72 registries for the diagnosis of new serious disease (cancer or serious non-malignant disease). We excluded
73 patients referred to the diagnostic centre from a hospital department and patients who declined complete
74 diagnostic workup.

75 *2.2 Setting and organisation of diagnostic pathway*

76 All Danish residents have free access to diagnostic services and treatment through the publicly funded
77 health-care system. The Danish medical services are divided into five regions, and each of these regions has
78 at least one diagnostic centre. Approximately 21 diagnostic centres have now been established in Denmark.
79 Silkeborg Regional Hospital is situated in the Central Denmark Region, and the diagnostic centre has a
80 catchment area of approx. 177,000 residents aged 18 years or older.

81 The triage function at Silkeborg Regional Hospital consists of imaging and a standardized blood test panel.
82 The imaging includes a combined thoracic X-ray and ultrasound of the upper and lower abdomen. A CT scan
83 of chest, abdomen and pelvis is performed if considered relevant by the radiologist. The results of the
84 investigations are returned to the GP within three working days. The GP decides on further diagnostic steps
85 within eight working days. If the triage function yields no obvious explanation for the patient's symptoms,
86 the GP is advised to refer the patient to the diagnostic centre.

87 The diagnostic centre is run by specialists in internal medicine. All patients are assigned a personal
88 coordinator during the diagnostic workup; the coordinator schedules visits for diagnostic investigations and
89 keeps track of the outpatient diagnostic trajectory.

90 The first visit to the diagnostic centre is scheduled within 1-3 days after referral. Based on the medical
91 history and the results of investigations, patients undergo individual diagnostic programmes; these are
92 developed in a close cooperation between relevant experts, and all medical specialties are represented in
93 the diagnostic centre. Furthermore, the diagnostic centre has made preferential arrangements with
94 specialists to hasten the diagnostic investigations (e.g. gynaecological examination, endoscopy, diagnostic
95 imaging and biopsy). The programme may include concurrent workup in different medical specialties (e.g.
96 gastroenterology and gynaecology), and these are coordinated in the diagnostic centre. All medical
97 specialties are available for consulting on daily multidisciplinary conferences. The diagnostic centre is
98 responsible for the patient during the entire diagnostic workup, which must be completed within 16
99 calendar days.

100 *2.3 Data*

101 Eligible patients were included from a clinical database at the diagnostic centre at Silkeborg Regional
102 Hospital. The data were consecutively recorded for each patient by the involved healthcare personal. We
103 assigned the index date as the date of first visit at the diagnostic centre. The unique civil registration
104 number assigned to all Danish residents at birth or immigration allowed linkage to national registries [7].
105 The clinical laboratory information system (LABKA) was used to retrieve information on results of blood
106 tests performed within 14 days from the index date [8]. Included blood tests were part of the standardized
107 blood test panel performed in the triage function, and test results were identified by unique codes in
108 LABKA [9].

109 Patients were followed up for three months after index date for diagnosis of cancer in the Danish Cancer
110 Registry (DCR) [10]. Patients with no registered malignant diagnosis in the DCR were followed up in the

111 National Patient Registry (NPR) for a non-malignant diagnosis [11]. Both registries were coded using the
112 International Classification of Diseases, 10th edition (ICD-10). For each person, only the incident diagnosis
113 was included; diagnoses registered within the ten years preceding the index date were excluded. Three
114 authors (EN, UF and PV) reviewed all diagnoses and dichotomised into: 1) serious disease or 2) not serious
115 disease. Disagreements were discussed until consensus was reached.

116 *2.4 Variables*

117 Symptoms were defined as presence or absence of 21 specified symptoms at the first visit to the diagnostic
118 centre. Clinical findings were defined as findings by the physician during the clinical examination of the
119 patient at the first visit to the diagnostic centre. Blood tests were defined as abnormal or normal for 15
120 specified routine blood tests according to the reference range established by the local department of
121 clinical chemistry. Diagnostic imaging was defined as abnormal on the basis of the description by the
122 radiologist if one of the following was found: 1) findings suspicious of malignancy or 2) non-malignant
123 findings requiring treatment or further diagnostic workup.

124 *2.5 Statistical analysis*

125 The outcomes in the data analysis were: diagnosis of cancer or new serious non-malignant disease within
126 three months after the index date. Categorical data were analysed as numbers and proportions. The
127 likelihood ratio (LR) of cancer and the LR of serious non-malignant disease were calculated for presented
128 symptoms, abnormal clinical findings, abnormal blood tests and diagnostic imaging. The 95% confidence
129 intervals (95% CI) were calculated assuming exact binomial distribution. No alterations were made for
130 missing data on presence/no presence of serious disease. The data analysis was conducted using Stata
131 statistical software v. 14.

132

133

134 2.6 Ethical considerations

135 The study was approved by the Danish Data Protection Agency (ref. no. 2013-41-2232). According to Danish
136 law, no approval was required from the Danish health research ethics committees for this type of study.

137 3. Results

138 3.1 Population

139 A total of 1356 patients aged 18 years or more were referred during the inclusion period. After exclusion of
140 384 (28.3%) internal referrals from hospital departments and 34 patients (2.5%) who declined complete
141 diagnostic workup, the study population consisted of 938 patients. The median waiting time from referral
142 to visit was one calendar day (interquartile range (IQI): 1-3 days) and the median time from first visit to last
143 visit was eight calendar days (IQI: 1-14) (data not shown).

144 3.2 Patient characteristics

145 The majority of referred patients were aged 60-79 years, and 516 patients (55%) were female (Table 1).
146 Two thirds had a normal performance status, and half of patients had one or more chronic diseases before
147 referral. A total of 30% were active smokers, and 20% of patients reported to consume alcohol on a daily
148 basis.

149 3.3 Diagnoses

150 A total of 327 (34.9%) patients were diagnosed with new serious disease: 118 patients (12.6%) were
151 diagnosed with a malignant disease and 209 patients (22.3%) were diagnosed with a new serious non-
152 malignant disease (Table 2). The diagnostic spectrum consisted of a mix of different disease groups. The
153 most frequent malignant disorders were haematological, colorectal, kidney, lung and pancreatic cancers.
154 The most common serious non-malignant diagnoses were rheumatic diseases, gastrointestinal diseases,
155 endocrine disorders and infectious diseases (Appendix A).

156 3.4 Presented symptoms and clinical findings at first visit

157 The majority of patients presented with two or more symptoms at the first visit to the diagnostic centre
158 (Appendix B). The diagnostic value of presenting symptoms is shown in Table 3. Most patients had one or
159 more general symptoms; the most frequent were weight loss, fatigue, loss of appetite, pain and general
160 malaise.

161 The LRs of cancer were highest in patients with a lump (LR = 3.2) and patients with general malaise (LR =
162 1.8). Presented symptoms had a weaker association with non-malignant disease. The LR of non-malignant
163 disease was highest in patients with pain (LR=1.4) or fatigue (LR=1.3). The LRs of cancer and non-malignant
164 disease increased only marginally with increasing number of presented symptoms at first visit (Appendix B).

165 Table 4 shows the diagnostic value of abnormal clinical findings. Patients with abnormal clinical findings
166 had an increased LR of both cancer and non-malignant disease. Abdominal mass (LR = 8.4) and lymph nodes
167 (LR = 3.0) had high LRs of cancer. Swollen or tender joints (LR = 5.6) were associated with the highest LRs of
168 non-malignant disease.

169 3.5 Abnormal blood test results and abnormal diagnostic imaging

170 Table 5 shows the diagnostic value of abnormal blood tests. The three most common laboratory findings
171 were high inflammatory markers, anaemia and hypoalbuminaemia. High lactate dehydrogenase showed
172 the strongest association with cancer (LR = 2.3), but no association was found with the diagnosis of non-
173 malignant disease (LR = 0.9). For the remaining blood tests, the LRs of cancer and of non-malignant disease
174 ranged from 1.0 to 2.2.

175 Table 6 shows the diagnostic value of available imaging results at first visit to the diagnostic centre.
176 Abnormal findings on all three imaging modalities showed an increased LR of cancer. The LR of cancer was
177 highest in patients with abnormal findings on abdominal ultrasound (LR=3.6). The LR of cancer was also
178 increased among patients referred to a supplementary CT scan by the radiologist (LR=1.8). If abnormal

179 findings were seen on the CT, the resulting post-test probability of being diagnosed with cancer was 27.9
180 (95% CI: 22.6; 33.7) compared to 3.9% (95% CI: 1.3; 8.9) if no abnormal findings were seen in the CT scan. **4.**

181 **Discussion**

182 *4.1 Main findings*

183 Of patients referred to the diagnostic centre, 34% were diagnosed with a new serious disease. The
184 diagnostic spectrum was broad and consisted of both malignant disease (12%) and serious non-malignant
185 disease (22%). Patients presented with various symptoms at first visit, but the majority presented with one
186 or more general symptoms. Abnormal laboratory findings were common, but most were unspecific to
187 cancer or non-malignant disease. This shows that the symptom pattern in these patients vary considerably
188 and that they present many different signs of potential disease.

189 *4.2 Discussion of findings and comparison with existing literature*

190 The risk of cancer among patients referred to the urgent referral for non-specific serious symptoms has
191 been reported to be between 12% and 22% in previous studies [3,12,13]. A UK study found the risk of
192 cancer to be 11% for patients referred to an urgent referral pathway for a specific cancer type [14]. Several
193 factors may explain the high risk of cancer in our study. First, all patients were referred after a GP-based
194 triage function. Secondly, referrals were based on the GPs' suspicion of serious disease, which has a relative
195 high positive predictive value of cancer [3,15,16]. Finally, the positive predictive value of non-specific
196 symptoms for cancer in primary care are of a magnitude corresponding to many specific alarm symptoms
197 [16,17]. Still, the appropriate conversion rate of cancer among patients referred to the diagnostic centre
198 must be examined in further studies.

199 Serious non-malignant diseases were frequent in our study, and they consisted of a wide variety of
200 diagnoses within different medical specialities. The findings highlight the importance of taking a wide

201 diagnostic approach to patients referred with non-specific serious symptoms; this also includes providing
202 easy access to relevant medical specialities at the diagnostic centres.

203 In primary care, general symptoms (such as unintended weight loss, fatigue or loss of appetite) are
204 frequently seen among consulting patients who are later diagnosed with cancer [18,19]. However, these
205 symptoms are also features of both self-limiting and serious non-malignant conditions. It may thus be
206 difficult for the GP to identify the correct referral pathway for patients presenting with general symptoms.
207 The clinical consequence is that the diagnosis of any serious disease may be delayed. For some cancer
208 types, this can lead to poorer survival [20]. The diagnostic centre offers a fast-track evaluation to confirm or
209 refute the suspicion of serious disease in the patients. However, further studies are needed to analyse the
210 prognosis among patients referred to the diagnostic centres.

211 Patients suspected of malignancy on chest X-ray or abdominal ultrasound in the triage function were
212 offered a direct CT scan of thorax, abdomen and pelvis. At other diagnostic centres, all patients are offered
213 a CT scan of thorax, abdomen and pelvis in the triage function immediately after referral from the GP [12].
214 Our findings suggest that chest X-ray, abdominal ultrasound and CT scan may all be useful in the initial
215 diagnostic approach. A potential disadvantage of an indiscriminate use of CT scans in patients with non-
216 specific symptoms may be: 1) risk of radiation exposure, 2) higher resource allocation and 3) incidental
217 findings and overdiagnosis. Still, the effect of different radiological strategies among patients referred with
218 non-specific serious symptoms needs to be examined in further studies.

219 *4.3 Strengths and limitations*

220 The key strengths of this study are the prospective collection of data with nearly complete registration of
221 all patients referred to the diagnostic centre. Furthermore, the information was systematically registered in
222 the database by clinicians, and the included blood tests were all performed as part of a standardised panel,
223 which reduced the risk of information bias. Additionally, the calculated likelihood ratios are not dependent
224 on the prevalence of disease, which increases the generalisability of the results.

225 The register data are considered valid and complete as information in the DCR is registered continuously on
226 the basis of national registries, and the records have been shown to be highly accurate [10]. The
227 completeness in the NPR is high for serious non-malignant diseases as these should always lead to hospital
228 activity [11]. The same applies for the LABKA system, which forms the basis of all clinical information on
229 blood test results in the Central Denmark Region [8].

230 We used a follow-up period of three months as we wanted to include incident diagnoses that were
231 associated with the diagnostic workup in the urgent referral for non-specific serious symptoms. We chose
232 to exclude patients who declined complete diagnostic workup; this was done to avoid any information bias
233 from incomplete registrations of diagnoses in the national registries for these patients. However, we were
234 not able to confirm whether all new diagnoses of serious disease were associated with workup at the
235 diagnostic centre.

236 We focused on calculating the diagnostic value of single clinical characteristics in the diagnosis of cancer
237 and serious non-malignant disease as our aim was to describe the clinical characteristics in this previously
238 undescribed group of patients. However, in clinical practice, diagnostic clues obtained from patient history,
239 clinical examinations, blood tests and imaging results are often mutually dependent [21]. Further studies
240 applying a multivariable approach are needed to analyse how the different clinical information available at
241 first visit to the diagnostic centre may help the diagnostic workup in practice.

242 We included only patients referred from the GP, thereby reducing any selection bias introduced by internal
243 referrals from other hospital departments. Still, our results are based on only a single centre, and the
244 diagnostic spectrum may be different in other settings.

245 **5. Conclusions**

246 Patients referred by their GP to the diagnostic centre have a high risk of serious disease, and the diagnostic
247 centre constitutes an initiative to support the GP in the difficult diagnostic workup when serious disease is

248 suspected. The diagnostic spectrum is wide among patients referred with non-specific serious symptoms,
249 and patients presenting with non-specific serious symptoms in general practice may be at risk of
250 experiencing multiple referrals to different medical specialities and a fragmented diagnostic pathway. The
251 urgent referral pathway for non-specific serious symptoms enables the GP to refer patients to the
252 diagnostic centre for a coherent and coordinated diagnostic trajectory.

253 At the diagnostic centre, a multidisciplinary diagnostic approach is needed to ensure that the wide
254 spectrum of both malignant and benign diseases is taken into account. It is a crucial feature that the
255 diagnostic centres are organised with easy access to relevant investigations and different medical
256 specialities.

257 **Acknowledgements**

258 We would like to thank all participating doctors at the diagnostic centre at Silkeborg Regional Hospital for
259 contributing by reporting to the database. We would especially like to thank consultant Vera Haahr and the
260 clinical coordinators at the diagnostic centre for collecting the data for the study. The authors also wish to
261 thank laboratory technician Hanne Pedersen for her work with retrieving the data from LABKA and data
262 manager Kaare Rud Flarup for his assistance with the data retrieval from the Danish national registries.

263 The project was supported by the Health Research Fund of the Central Denmark Region, ML Jørgensen and
264 Gunnar Hansen's Foundation, the Danish General Practice Fund, and Rosa & Asta Jensen's Foundation. The
265 funding bodies had no role in the design of the study, in the collection, analysis, and interpretation of data,
266 or the writing of the article.

Male	422	(45.0%)
Age group (yrs)		
18-39	47	(5.0%)
40-59	243	(25.9%)
60-79	546	(58.2%)
> 80	102	(10.9%)
WHO performance status^a		
0	588	(65.9%)
1	198	(22.2%)
≥ 2	107	(12.0%)
Chronic diseases prior to referral^a		
0	456	(51.1%)
1	142	(15.9%)
2	140	(15.7%)
≥ 3	155	(17.4%)
Type of chronic disease^a		
Hypertension	208	(23.3%)
Osteoarthritis or inflammatory arthritis	110	(12.3%)
Earlier cancer (besides non melanoma skin cancer)	98	(11.0%)
Chronic obstructive lung disease	96	(10.8%)
Diabetes	82	(9.2%)
Ischemic heart disease	72	(8.1%)
Mental illness ^b	65	(7.3%)
Stroke	55	(6.2%)
Osteoporosis	49	(5.5%)
Smoking^a		
Current smoker	263	(29.4%)
Former smoker/intermittent smoking	288	(32.3%)
Never smoked	342	(38.3%)
Drinking habits^a		
Daily drinking	173	(19.4%)
No daily drinking	720	(80.6%)

324 ^a 893 number of valid responses.

325 ^b 41 patients had mild to medium mental illness, and 24 had moderate to severe mental illness.

326

327
328
329

Table 2

Type of serious disease among 118 patients diagnosed with cancer and 209 patients diagnosed with a non-malignant disease

Variable	Number of patients (%)	
Cancer		
Diagnosed with cancer within three months	118	(12.6%)
Cancer type		
Haematological cancer ^a	30	(25.4%)
Colorectal cancer	21	(17.8%)
Kidney cancer	12	(10.2%)
Lung cancer	11	(9.3%)
Pancreatic cancer	10	(8.5%)
Prostate cancer	8	(6.8%)
Ovarian cancer	7	(5.9%)
Upper gastro-intestinal cancer	6	(5.1%)
Breast cancer	4	(3.4%)
Primary site unknown	4	(3.4%)
Other specific cancer types ^b	5	(4.2%)
Non-malignant disease		
Diagnosed with serious non-malignant disease within three months	209	(22.3%)
Medical speciality of non-malignant disease^c		
Rheumatology	54	(25.8%)
Gastroenterology	38	(18.2%)
Endocrinology	31	(14.8%)
Infectious diseases	28	(13.4%)
Haematology	19	(9.1%)
Respiratory medicine	18	(8.6%)
Vascular diseases	16	(7.7%)
Cardiology	14	(6.7%)
Nephrology	9	(4.3%)
Neurology	9	(4.3%)
Psychiatry	4	(1.9%)
Medical side effects	4	(1.9%)
Otorhinolaryngology	3	(1.4%)
Gynaecology and urology	3	(1.4%)

330 ^a Haematological cancers included 17 patients with lymphoma, 10 patients with malignant plasma cell
331 disorders and 3 patients with leukaemia.

332 ^b Refers to cancer types diagnosed in three or less patients.

333 ^c Proportion of diagnoses is over 100% as 34 patients had a mix of different serious non-malignant
334 diagnoses.

335 **Table 3**
336 Symptoms presented at first visit to the diagnostic centre and likelihood ratio (LR) of cancer and serious
337 non-malignant diseases (n = 893)

Symptom	Patients with symptom (%)		LR of cancer (95% CI)		LR of non-malignant disease (95% CI)	
General symptoms						
Any general symptom	763	(85.4%)	1.0	(0.9;1.1)	1.1	(1.0; 1.1)
Weight loss ^a	472	(52.9%)	1.0	(0.8; 1.2)	1.0	(0.9; 1.2)
Fatigue	437	(48.9%)	1.1	(0.9; 1.4)	1.3	(1.1;1.5)
Loss of appetite or nausea	323	(36.2%)	1.3	(1.0; 1.6)	0.9	(0.7; 1.1)
Pain ^b	256	(28.7%)	1.2	(0.9; 1.6)	1.4	(1.1; 1.7)
General malaise	231	(25.9%)	1.8	(1.4; 2.3)	1.0	(0.8; 1.3)
Night sweats	175	(19.6%)	1.1	(0.8; 1.6)	0.9	(0.6; 1.2)
Fever	58	(6.5%)	1.0	(0.5; 2.1)	1.4	(0.8; 2.5)
Focal symptoms						
Any focal symptom	517	(57.9%)	1.2	(1.0; 1.3)	1.1	(1.0; 1.2)
Lung symptoms						
Any lung symptom	229	(25.6%)	1.1	(0.8; 1.6)	1.2	(1.0; 1.6)
Shortness of breath	157	(17.6%)	1.4	(1.0; 2.0)	1.2	(0.9;1.7)
Cough	136	(15.2%)	0.9	(0.6; 1.5)	1.3	(0.9; 1.8)
Haemoptysis	9	(1.0%)	0.9	(0.1; 6.9)	0.0	n/a
Digestive symptoms						
Any digestive symptom	202	(22.6%)	1.2	(0.8; 1.6)	1.0	(0.7; 1.3)
Change of bowel habits	164	(18.4%)	1.3	(0.9; 1.8)	0.8	(0.6; 1.2)
Dysphagia	39	(4.4%)	1.0	(0.4; 2.6)	1.7	(0.9; 3.3)
Blood in stool	37	(4.1%)	0.6	(0.2; 2.0)	0.7	(0.3; 1.6)
Urological symptoms						
Any urological symptom	77	(8.6%)	2.0	(1.2;3.3)	1.4	(0.9;2.2)
Difficulty urinating	66	(7.4%)	1.7	(1.0; 3.0)	1.3	(0.8; 2.2)
Blood in urine	17	(1.9%)	2.9	(1.0; 8.1)	1.1	(0.4; 3.2)
Other symptoms						
Vertigo	148	(16.6%)	1.5	(1.0; 2.2)	1.2	(0.9; 1.7)
Headache	84	(9.4%)	0.5	(0.2; 1.1)	1.0	(0.6; 1.6)
Lump	57	(6.4%)	3.2	(1.9; 5.4)	0.3	(0.1; 0.8)
Abnormal vaginal bleeding ^c	11	(1.2%)	0.0	n/a	1.2	(0.3; 4.4)
Change in mole or sores that do not heal	10	(1.1%)	0.8	(0.1;6.1)	2.3	(0.7; 8.1)

338 ^a Weight loss within the last two months.

339 ^b Pain could be both generalised and localised.

340 ^c Abnormal vaginal bleeding among 495 women.

341 **Table 4**
342 Abnormal clinical finding at first visit to the diagnostic centre and likelihood ratio (LR) of cancer and serious
343 non-malignant disease (n = 893)

Clinical finding	Number of patients (%)		LR of cancer (95%CI)		LR of non-malignant disease (95%CI)	
Any abnormal clinical finding						
Yes	267	(29.9%)	1.9	(1.6 ;2.4)	1.6	(1.3; 1.9)
No	626	(70.1%)	0.7	(0.5; 0.8)	0.8	(0.7; 0.9)
Type of abnormal clinical finding						
Abdomen*	116	(13.0%)	3.0	(2.2; 4.3)	1.4	(1.0; 2.1)
Abdominal tenderness ^a	34	(3.9%)	1.8	(0.8; 4.1)	1.9	(0.9; 3.7)
Abdominal mass ^a	33	(3.7%)	8.4	(4.4; 16.2)	0.5	(0.2; 1.3)
Musculoskeletal	60	(6.7%)	0.8	(0.3; 1.7)	3.7	(2.3; 6.0)
Swollen or tender joints ^b	13	(1.5%)	0.6	(0.1; 4.4)	5.6	(1.8; 16.8)
Lymph node	47	(5.3%)	3.0	(1.6; 5.4)	0.5	(0.2; 1.2)
Chest**	43	(4.8%)	0.9	(0.4; 2.3)	2.0	(1.1; 3.7)
Skin	39	(4.4%)	1.5	(0.7; 3.4)	1.9	(1.0; 3.6)
Breast ^c	24	(4.9%)	1.1	(0.3; 3.5)	0.5	(0.2; 1.7)
Neurology	18	(2.0%)	0.9	(0.2; 3.7)	2.2	(0.9; 5.6)

344 * Abnormal findings in examination of abdomen or rectal digital examination.

345 **Abnormal auscultation of lung or heart.

346 ^a 882 valid registrations, ^b 890 valid registrations, ^c among 495 women.

347

348 **Table 5**
349 Abnormal blood test results and likelihood ratio (LR) of cancer and serious non-malignant disease

Test	Number of patients with valid tests	Number of patients with abnormal tests (%)	LR of cancer (95% CI)	LR of non-malignant disease (95% CI)
Haematology				
Low haemoglobin	873	305 (34.9%)	1.5 (1.2; 1.8)	1.6 (1.4; 2.0)
High platelet count	873	157 (18.0%)	1.8 (1.3; 2.6)	1.7 (1.3; 2.3)
High white blood cell count	873	119 (13.6%)	1.3 (0.9; 2.0)	1.5 (1.1; 2.1)
≥ 2 abnormal tests of the above	866	138 (15.9%)	1.9 (1.4; 2.7)	2.0 (1.5; 2.7)
Inflammatory markers				
High ESR	808	283 (35.0%)	1.6 (1.3; 2.0)	1.6 (1.3; 1.9)
High CRP	864	272 (31.5%)	1.9 (1.6; 2.3)	1.7 (1.4; 2.0)
2 abnormal test results	794	193 (24.3%)	1.7 (1.3; 2.2)	2.0 (1.6; 2.4)
Liver function tests				
Low albumin	874	210 (24.0%)	2.1 (1.6; 2.7)	1.5 (1.2; 1.9)
High alkaline phosphatase	862	159 (18.4%)	1.9 (1.4; 2.6)	1.2 (0.8; 1.6)
High ALK	863	66 (7.6%)	1.5 (0.8; 2.6)	1.4 (0.9; 2.4)
High bilirubin	861	19 (2.2%)	2.3 (0.9; 6.3)	1.0 (0.3; 2.8)
≥ 2 abnormal test results	857	105 (12.3%)	2.2 (1.5; 3.3)	1.6 (1.1; 2.4)
Metabolic tests				
High lactate dehydrogenase	838	100 (11.9%)	2.3 (1.5; 3.4)	0.9 (0.6; 1.4)
High calcium	820	65 (7.9%)	1.6 (0.9; 2.9)	1.2 (0.7; 2.0)
2 abnormal test results	796	7 (0.9%)	2.6 (0.5; 13.0)	1.5 (0.4; 5.5)

350 Abbreviations: ESR = Erythrocyte sedimentation rate; CRP = C-reactive protein; ALK = Alanine amino-
351 transaminase.

352

353 **Table 6**
354 Available imaging for clinical assessment at first visit to the diagnostic centre and likelihood ratio (LR) of
355 cancer and serious non-malignant disease

Imaging	Number of patients (%)		LR of cancer (95% CI)		LR of non-malignant disease (95% CI)	
Chest X-ray^a						
Abnormal findings on chest X-ray	113	(14.0%)	1.8	(1.2; 2.7)	1.7	(1.2; 2.5)
No abnormal findings on chest X-ray	696	(86.0%)	0.9	(0.8; 1.0)	0.9	(0.8; 1.0)
Abdominal ultrasound^b						
Abnormal findings on ultrasound	155	(18.8%)	3.6	(2.8; 4.7)	0.9	(0.6; 1.2)
No abnormal findings on ultrasound	600	(72.6%)	0.5	(0.4; 0.7)	1.0	(0.9; 1.1)
Inconclusive ultrasound examination	71	(8.6%)	1.1	(0.6; 2.1)	1.1	(0.7; 1.9)
Supplementary CT scan performed^{c*}						
Yes	404	(45.2%)	1.8	(1.6; 2.1)	1.2	(1.0; 1.4)
No	489	(54.8%)	0.4	(0.3; 0.6)	0.9	(0.7; 1.0)
Results of CT scan^{d**}						
Abnormal findings on CT scan	265	(67.6%)	1.5	(1.4; 1.7)	1.1	(0.9; 1.2)
Normal findings on CT scan	127	(32.4%)	0.2	(0.1; 0.4)	1.0	(0.7; 1.3)

356 *The radiologist decided whether a supplementary CT scan of thorax, abdomen and pelvis was needed
357 based on results from chest X-ray and abdominal ultrasound.

358 ** The likelihood ratio among patients referred to CT scan by the radiologist.

359 ^a 809 valid registrations, ^b 826 valid registrations, ^c 893 valid registrations, ^d 392 valid registration.

360

361 **Appendix A.**
 362 Overview of diagnosed serious non-malignant diseases in the four most common medical specialities

Variable	Number of patients (%)	
Rheumatology (n = 54)		
Polymyalgia rheumatic and giant cell arteritis	25	(46.3%)
Inflammatory arthritis	17	(31.5%)
Sarcoidosis	7	(13.0%)
Osteoporosis with pathological fractures	5	(9.2%)
Gastroenterology (n = 38)		
Gastrointestinal tract disease	21	(55.3%)
Liver and biliary disease	9	(23.7%)
Pancreatic disease	8	(23.0%)
Endocrinology (n = 31)		
Thyroid disease	15	(48.4%)
Diabetes mellitus	5	(16.1%)
Other endocrinological diseases	11	(35.5%)
Infectious diseases (n = 28)		
Pneumonia	11	(39.3%)
Other infectious diseases	17	(60.7%)

363
 364

365 **Appendix B.**
366 Number of symptoms registered at first visit to the diagnostic centre and likelihood ratio (LR) of cancer and
367 non-malignant disease (n = 893)

Number of symptoms	Number of patients with symptom (%)		LR of cancer (95% CI)		LR of non-malignant disease (95% CI)	
All symptoms ^a						
0	77	(8.6%)	0.8	(0.5; 1.3)	0.8	(0.5; 1.1)
1	157	(17.6%)	0.8	(0.5; 1.3)	0.8	(0.5; 1.1)
2-3	303	(33.9%)	0.8	(0.6; 1.1)	1.0	(0.8; 1.3)
≥ 4	356	(39.9%)	1.3	(1.1; 1.6)	1.2	(1.0; 1.4)
General symptoms ^b						
0	130	(14.6%)	1.0	(0.6; 1.6)	0.6	(0.4; 1.0)
1	217	(24.3%)	0.8	(0.6; 1.2)	1.0	(0.8; 1.1)
2-3	362	(40.5%)	0.9	(0.7; 1.1)	1.0	(0.9; 1.3)
≥4	184	(20.6%)	1.4	(1.1; 1.9)	1.3	(1.0; 1.6)
Focal symptoms ^c						
0	376	(42.1%)	0.8	(0.6; 1.1)	0.9	(0.7; 1.1)
1	274	(30.7%)	0.9	(0.7; 1.3)	1.1	(0.9; 1.4)
2-3	196	(22.0%)	1.4	(1.0; 1.9)	1.2	(0.9; 1.5)
≥ 4	47	(5.3%)	1.4	(0.7; 3.0)	0.9	(0.5; 1.8)

368 ^a The 21 different symptoms are shown in table 3 in the article.

369 ^b Fatigue, fever, general malaise, loss of appetite, night sweats, pain and weight loss.

370 ^c Blood in stool, blood in urine, change of bowel habits, cough, difficulty urinating, dysphagia, haemoptysis,
371 headache, lump, shortness of breath and vertigo.
